

Sales process, forms and views

1. Typical sales process in Dynamics 365

Once the Sales Trial is activated, in Dynamics 365 we can access all the available apps within the Sales module.

Such module is designed to help organizations manage their sales processes efficiently and improve customer relationships. The Sales module provides tools and features that enable sales teams to track leads, manage opportunities, and streamline the sales pipeline.

Here are some key aspects of the Sales module in Dynamics 365:

1. **Lead Management:** The Sales module allows users to capture and track leads, which are potential customers. Leads can be qualified and converted into opportunities as they progress through the sales process.
2. **Opportunity Management:** Users can manage sales opportunities, which represent potential revenue from a customer. The system helps track the status of opportunities, associated activities, and potential revenue. This includes details such as the opportunity stage, estimated close date, and probability of closing.
3. **Account and Contact Management:** Dynamics 365 Sales enables organizations to maintain a centralized database of customer accounts and contacts. This information can be linked to sales activities, opportunities, and other relevant data.
4. **Product and Price List Management:** Users can maintain a catalog of products and services, including pricing information. This allows sales representatives to associate products with opportunities and generate quotes for customers.

5. **Sales Process Automation:** The Sales module supports the automation of sales processes, helping organizations define and enforce consistent workflows. This includes automating tasks, sending notifications, and ensuring that sales representatives follow standardized processes.
6. **Integration with Microsoft 365:** Dynamics 365 Sales is tightly integrated with Microsoft 365, facilitating collaboration and communication among team members. This integration includes features such as email tracking, calendar synchronization, and document management.
7. **Analytics and Reporting:** The module provides reporting and analytics tools to help organizations gain insights into their sales performance. Users can create dashboards and reports to monitor key metrics, track progress, and make data-driven decisions.
8. **Customization and Extensibility:** Organizations can customize the Sales module to align with their unique business processes. This includes adding custom fields, modifying forms, and creating custom workflows. Additionally, the Power Platform (Power BI, Power Apps, Power Automate) can be used to extend the functionality further.

Dynamics 365 - custom app provides a combination of areas: Sales, Service, Marketing, Training.

Let us talk a bit more about Leads.

The screenshot shows the Dynamics 365 Sales interface with a list of open leads. The left sidebar contains navigation options: My work, Dashboard, Sales accelerator, Activities, Calendar, Tasks, Calls, Pipeline, Leads (selected), Opportunities, Forecasts, Customers, Contacts, Accounts, Learn, and Resources. The main area displays a table of leads with columns: Name, Topic, Status Reason, and Created On. The table lists 16 leads, all with a status of 'New' and a creation date of 12/17/2023 9:56 AM. A 'Take a tour' button is visible in the bottom right corner.

As we said, a lead represents a potential sales opportunity or a person or organization that has expressed interest in a product or service but has not yet become a customer. Leads are often the starting point in the sales process, and they go through various stages before being qualified and converted into opportunities or accounts.

Here are the key characteristics and aspects of leads in Dynamics 365 Sales:

1. **Lead Creation:** Leads are typically created when someone expresses interest in our products or services. This could happen through various channels, such as a website inquiry, a trade show, a marketing campaign, or a cold call.

The screenshot shows the Dynamics 365 Sales interface with a detailed view of a lead named Kenya Brady. The left sidebar is the same as the previous screenshot. The main area displays the lead's details, including contact information, company information, and a timeline of activities. The lead is currently in the 'Qualify' stage, with a 'Lead to Opportunity Sales' button. The 'Who Knows Whom' section shows contacts like Alan Steiner, Jeremy Johnson, and David Mallory. The 'Lead score' section shows a score of 90, Grade A, with a 'Steady' trend. A 'Take a tour' button is visible in the bottom right corner.

Lead score

90 Grade A
 → Steady
 ▲ Purchase timeframe is next quarter
 ▲ Purchase process is individual
 ▲ Lead is relatively new
 ▲ Estimated budget is \$50,000.00

2. **Lead Qualification:** The qualification process involves assessing the lead's potential to become a customer. It includes gathering information about the lead, such as their needs, budget, and timeline. During this stage, the sales team evaluates whether the lead meets the criteria for being a viable sales opportunity.
3. **Lead Conversion:** Once a lead has been qualified and deemed suitable for further pursuit, it can be converted into an opportunity in Dynamics 365 Sales. This process involves creating a record for the opportunity, associating it with the lead, and transferring relevant information.

4. **Lead Tracking:** Dynamics 365 allows sales teams to track and manage leads through various stages of the sales process. This includes recording interactions, updating status, and attaching relevant documents or notes to the lead record.
5. **Communication and Follow-up:** The system facilitates communication with leads, such as sending emails, making phone calls, and scheduling appointments. The goal is to nurture the relationship and move the lead through the sales pipeline.
6. **Lead Scoring:** Some organizations use lead scoring mechanisms to prioritize leads based on certain criteria, such as the level of interest, budget, or industry. This helps sales teams focus their efforts on the most promising opportunities.
7. **Integration with Marketing:** Dynamics 365 Sales is often integrated with marketing automation tools, allowing organizations to seamlessly move leads from marketing campaigns to the sales pipeline. This integration ensures a cohesive and streamlined approach to lead management.

The following figure displays the typical sales process.

Summarizing, first we have to identify a lead. Then, if we are pleased with the lead, we qualify it and convert it to an opportunity. Once the opportunity is created, we will link the opportunity to the customer. Most of the times the customer might be already present, but they might want to purchase some new product from our company. If the customer is not present in our database yet, in Dynamics 365 we can create a new customer's profile and associate them with the opportunity. Once the opportunity is created successfully, we will create the quote for that customer. This contains the products or services that are part of the deal: it has a name and an expiration date. Once the quote is accepted by the customer, we will create the order. Once the order is fulfilled, we create and send the invoice to the customer. This is the entire sales process: Qualify, Develop, Propose, Close, Fulfill. Dynamics 365 provides some predefined modules, but if we don't want to use such modules, we can create our own modules. The invoice entity, for example, may be modified as we want inside Power Apps.

Everything is customizable, also the sitemap (Activities, Pipeline, Customers, . . .).

In the Sales Hub app we have an area called Collateral, which contains Quotes, Orders, Invoices, Products and Sales Literature. In the context of the Sales module of Dynamics 365, "collateral" typically refers to marketing and sales materials that are used to support the sales process. These materials are designed to provide information, address customer concerns, and help sales representatives communicate effectively with potential customers.

The screenshot displays the Dynamics 365 Sales Hub interface. On the left is a navigation pane with sections like 'My Work', 'Customers', 'Sales', and 'Collateral'. The 'Collateral' section is expanded, showing a list of items including 'Kenya Brady', 'Ivan Cashin', 'Reuben Kidd', 'Winford Asher', 'Gerald Stephens', 'Halle Griffiths', and 'Harriet Parrish'. The main area shows a detailed view of the 'Kenya Brady' lead card. The card includes a progress bar with stages: 'Lead to Opportunity Sales' (Active for 9 days), 'Qualify', 'Develop (13 Min)', 'Propose', and 'Close'. Below the progress bar, there are sections for 'Up next' (Introduction mail, Reminder email, Call customer), 'Relationship health' (Good relationship and Improving), and 'Assistant' (No notifications or suggestions).

2. How to edit a form

If we open Invoices, and choose + New for creating a new invoice, we will see all the fields which are pre-generated by Microsoft.

The screenshot displays the Dynamics 365 Sales Hub interface for creating a new invoice. The 'New Invoice' form is open, showing a 'Summary' tab. The form includes fields for 'Invoice ID*', 'Name*', 'Currency*' (set to Euro), 'Price List', 'Prices Locked*' (set to No), 'Detail Amount', 'Discount (%)', 'Discount', 'Pre-Freight Amount', 'Freight Amount', 'Total Tax', and 'Total Amount'. There are also sections for 'SHIPPING DATES' (Date Delivered, Due Date) and 'SHIPPING INFORMATION'. The right sidebar shows 'SALES INFORMATION' with fields for 'Opportunity', 'Order', 'Customer*', and 'Description'.

Using Power Apps, it is possible to customize this view by adding or removing fields.

Let us navigate to the Forms section associated with our Expenses entity.

Here we have Main, Quick View and Card forms. The **main** form is the primary form used to display and edit records in Power Apps. It is the primary interface through which users interact with data. **Quick view** forms provide a way to show data from related records on the main form without navigating away. They are useful for displaying summarized or contextual information from related entities. Quick view forms are read-only and are primarily used for reference or to provide additional context. These forms can be added to the main form and configured to display fields from related records. **Card** forms are designed for compact and focused views of data. They are often used in dashboards or other situations where a condensed view of information is needed.

Card forms typically display a single record at a time and are intended for quick reference rather than extensive data entry. They are suitable for scenarios where space is limited or where a quick overview is more important than detailed information.

First, we modify an existing form, namely the Information main form of Expenses.

In most of the real-world scenarios we will have many departments in a company: sales, marketing, customer service, etc. . Each of them needs to see different data. In this case we create multiple forms in Power Apps.

Open Demo > Tables > Expenses > Forms in Power Apps. Then open the Information main form.

With a simple drag and drop procedure we can add the fields we want from the menu on the left. Each of these fields has its own editable properties. If we want to add a tab, we go to Components and select 1-column tab.

We can also add 2-column tabs, and/or inside a new tab add 1-column or 2-column sections.

The screenshot shows the Power Apps Form Designer interface. The top bar includes the 'Power Apps | Form' title, a search bar, and the 'Environment Sales Trial' status. The left sidebar contains a 'Table columns' panel with a search bar and a list of columns: 'Created By', 'Created By (Delegate)', 'Modified By (Delegate)', 'Modified On', 'Owning Business Unit', and 'Status'. The main canvas displays a form titled 'New Expenses' with a tabbed interface. The 'New Tab' is selected, showing two sections: 'New Section' with a 'Created On' field and another 'New Section' with a 'Modified By' field. The bottom status bar indicates the form is 'Responsive (1274 x 761)' and has a 'Show hidden' toggle set to 'Off'.

The screenshot shows the Power Apps Form Designer interface. The top bar includes the 'Power Apps | Form' title, a search bar, and the 'Environment Sales Trial' status. The left sidebar contains a 'Table columns' panel with a search bar and a list of columns: 'Created On', 'Modified By', 'Modified By (Delegate)', 'Owning Business Unit', and 'Status'. The main canvas displays a form titled 'New Expenses' with a tabbed interface. The 'New Tab' is selected, showing two sections: 'New Section' with 'Modified By (Delegate)' and 'Modified On' fields, and another 'New Section' with 'Created By' and 'Created By (Delegate)' fields. The bottom status bar indicates the form is 'Responsive (1274 x 761)' and has a 'Show hidden' toggle set to 'Off'.

The label of a field can be hidden, and the field can be set to be in a read-only state (so that the user cannot modify it).

Some fields can be set to be mandatory, by setting Business required in the Required menu.

Once we are done with the modifications to the form, we click on Save and publish.

Then if we open Dynamics 365 in the Expense System app, and add a new expense, the form which appears will contain the modifications that we did. The following is an example of an already saved expense (notice that the amount of money is not shown).

The screenshot shows the Dynamics 365 Expense System app interface. The left sidebar contains navigation options: Home, Recent, Pinned, Expense Group, Contacts, Expenses (selected), and Open Google. The main content area displays the 'EXPENSE-100000' record, which is 'Saved'. The 'General' tab is active, showing fields for Expense ID (EXPENSE-100000), Expense Type (Flight), Status Reason (Active), and Owner (Nicola Paracone). A Description field is also present with a placeholder '---'.

Assuming that we have added also a table column called Expense Amount to the form we were editing before, in Dynamics 365 we can now compile a new expense request in which we have to add the amount of money.

The screenshot shows the Dynamics 365 Expense System app interface for a 'New Expenses' form. The left sidebar is the same as the previous screenshot. The main content area displays the 'New Expenses' form with the 'General' tab active. The fields are: Expense ID (placeholder '---'), Expense Type (placeholder '---'), Expense Amount (placeholder '---'), Status Reason (Active), and Owner (Nicola Paracone). A Description field is also present with a placeholder '---'.

Once we save, the Expense ID will be automatically generated (remember that it is of autonumber type).

3. Create a brand new form

Now we create a new form. Open Power Apps and navigate to Demo > Tables > Expenses > Forms; then click on + New form and choose Main Form. The name we give it is Expense Manager Form.

The screenshot shows the 'Form' editor in Power Apps. The title bar indicates 'Power Apps | Form'. The left sidebar shows 'Table columns' with a search bar and a list of columns: Created By (Delegate), Created On, Expense Amount (Base), Modified By (Delegate), Modified On, Owning Business Unit, and Status. The main area displays the 'New Expenses' form with a 'General' tab selected. The form fields include: Expense ID (text), Expense Type (text), Currency (text), Expense Amount (text), Exchange Rate (text), Status Reason (text, set to 'Active'), Created By (text), Modified By (text), Owner (text, set to 'Nicola Paracone'), and Description (text). The bottom status bar shows 'Responsive (1274 x 761)' and 'Show hidden' toggle.

When we create a new main form, whatever information we had earlier in the previous main form is duplicated into the one we are creating. As before we can add and/or remove fields as we want. Once we are done, we click on Save and publish.

At this point, open the Expense System app and click on the Expenses form.

The screenshot shows the 'Expense System' app in Power Apps. The title bar indicates 'Power Apps | Expense System'. The left sidebar shows 'Pages' with a search bar and a list of pages: Expense Group, Contacts view, Contacts form, Expenses view, Expenses form (selected), and Open Google. The main area displays the 'New Expenses' form with a 'General' tab selected. The form fields include: Expense ID (text), Expense Type (text), Expense Amount (text), Status Reason (text, set to 'Active'), Owner (text, set to 'Nicola Paracone'), and Description (text). The bottom status bar shows 'Responsive (995 x 781)' and 'Include all forms in the app' toggle.

Here we set the Expense Manager Form as the form which will be displayed in Dynamics 365 when compiling a new expense request (if it does not work immediately, try to publish all customization and refresh). Once we open Dynamics 365, we will see that Expense Manager Form will be present in the drop-down menu.

The screenshot shows the Dynamics 365 interface for the 'EXPENSE-100000' form. The left sidebar contains navigation options: Home, Recent, Pinned, Expense Group, Contacts, Expenses (selected), and Open Google. The main area displays the form details for 'EXPENSE-100000' under the 'General' tab. The form fields include: Expense ID (EXPENSE-100000), Expense Type (Flight), Currency (---), Expense Amount (---), Exchange Rate (---), Status Reason (Active), Created By (Nicola Paracone (Available)), Modified By (Nicola Paracone (Available)), and Owner (Nicola Paracone (Available)). A Description field is also present at the bottom.

To decide who can access and view this form, we can define the form's security roles.

The screenshot shows the Power Apps Form editor interface for the 'New Expenses' form. The left sidebar lists various table columns and their properties. The main area displays the 'Form settings' dialog box, which includes a 'Security roles' section. This section allows users to assign security roles to the form, with options for 'Everyone' (selected) and 'Specific security roles'. The dialog also includes a 'Save and publish' button and a 'Cancel' button. The background shows the form's properties, including the display name 'Expenses' and the description 'A form for this entity.'

4. How to edit views

By default, when in Expenses inside Dynamics 365, we will see only Active and Inactive Expenses.

Of course, we can edit the drop-down menu and create more views.

Inside Power Apps, navigate to Demo > Tables > Expenses > Views; the first thing we can do here is to modify the Active Expenses view by adding more columns, again via a simple drag and drop operation.

Notice that there is an Edit filters option. There we can set a filter such as that displayed in the following figure.

Always remember to save and publish once you are done.

5. Create a new view

Let us we create a new view and set some filters to it.

In the new view we can add Expense Amount, Expense Type, Description, Created By.

Then we add the filters we want.

In some cases, we might want to see expenses in between two values, say 500 and 1000.

Notice that the drop-down option is set to And. This means that both conditions must be satisfied (evaluated to true). With Or, only one of the conditions must be satisfied.

Once the new views are saved and published, they will appear in Dynamics 365.

It is not necessary to create a new view from scratch each time. Once one is created and we have saved it with a name, we can continue to edit it, click on Save As and choose a different name.

Unfortunately, in setting up a filter group it is not directly possible to compare related entities. It is necessary to add a related table.

6. Associate expenses with customers using relationships

When we create a new expense, we should be able to display which customer the expense belongs to. Any customer can have an arbitrary number of expenses (**one-to-many relationship**), but each expense is associated only with one customer. Most of the times we avoid creating many-to-many relationships. Since each contact can own any number of expenses, we will have a subgrid in the "one" side of the relationship, and a lookup in the "many" side of the relationship.

Generally speaking, after setting up a relationship between two entities in Dynamics 365, we can leverage the benefits of that relationship to enhance various aspects of our data management, user experience, and business processes.

Here are several actions we can take after establishing a relationship:

1. **Associate and Disassociate Records:** Associate records from one entity with records from another entity. For example, if you have a relationship between the Account and Contact entities, you can associate specific contacts with a particular account.
2. **Retrieve Related Data:** Use the relationship to retrieve related data when querying records. This is especially useful for creating advanced queries or reports that involve data from both entities.
3. **Lookup Fields:** Utilize lookup fields to establish visual connections between records in different entities. Lookup fields can be used in forms to provide a dropdown list of related records for easy selection.
4. **Subgrids:** Add subgrids to forms to display related records directly within the form of another entity. This provides a convenient way to view and manage associated records.
5. **Create Views and Reports:** Leverage relationships when creating views and reports to display data from related entities. This can provide comprehensive insights into the relationships between records.
6. **Business Rules and Workflows:** Incorporate relationships into business rules and workflows to automate processes based on related data. For example, we can trigger a workflow when a related record meets certain criteria.
7. **Rollup Fields:** Use rollup fields to aggregate data from related records and display summary information on a parent record. This is useful for calculations, such as counting the number of related child records.
8. **Security Roles:** Manage access to related data by configuring security roles. Define which users or teams have access to records based on their relationships with other records.
9. **Cascade Behavior:** Configure cascade behavior to determine how changes to records in one entity affect related records in another entity. For example, we can set up cascading deletes to automatically delete related records when the parent record is deleted.
10. **Web Resources and Custom Code:** Extend the functionality of related records using web resources or custom code. This allows for additional customization and integration with external systems.
11. **Custom Apps and Power Pages:** Build custom apps or Power Pages that take advantage of the established relationships to create a tailored user experience.

Go to Demo > Tables > Expenses > Relationships and click on + New Relationship. Then choose Many-to-one.

Save a copy Save and publish ▾

Then save and publish. Contact will now appear as a field of the Information form displayed when compiling a new expense.

Say that the new expense is owned by Avery Howard.

The screenshot shows the Dynamics 365 Expense System interface. The left sidebar contains navigation options: Home, Recent, Pinned, Expense Group, Contacts, Expenses (selected), and Open Google. The main content area displays the details for expense **EXPENSE-100002**, which is marked as 'Saved'. The 'General' tab is active, showing the following information:

- Expense ID: EXPENSE-100002
- Expense Type: Flight
- Expense Amount: €200.00
- Contact: Avery Howard
- Status Reason: Active
- Owner: Nicola Paracone (Available)

Below this information is a 'Description' field containing three dashes (---).

If we go that customer's profile and click on Related, and then Expenses, we will find the expense that we have compiled before associated with that precise contact.

The screenshot shows the Dynamics 365 interface for the contact **Avery Howard**. The 'Expenses' tab is selected under the 'Related' section. The view is titled 'Expenses Associated View' and includes a search bar 'Filter by keyword'. The table below lists the expenses associated with this contact:

Expense ID	Created On
EXPENSE-100002	12/27/2023 11:24 AM

At the bottom of the page, it indicates '1 - 1 of 1' and 'Page 1'.

Instead of having to go to Related, we can make Expenses appear by default in the contact view. To do so, we navigate to Demo > Tables > Contact > Forms. Here we click on Add existing form and choose Contact.

Once it is added, open it and add a 1-column-tab (from Components) called Expenses. Then add a subgrid related to Expenses (it is recommended to hide the section label).

Save and publish.

Refresh Dynamics 365 and notice that Expenses will appear as a default tab of the Contact view.

The screenshot displays the Dynamics 365 user interface. On the left is a navigation pane with options like Home, Recent, Pinned, Expense Group, Contacts, Expenses, and Open Google. The main area shows the 'Avery Howard' contact record. The 'Expenses' tab is selected, showing a table with one entry: 'EXPENSE-100002' created on '12/27/2023 11:24 AM'. The top bar includes standard Dynamics 365 actions like Save, New, and Delete, along with a 'Try the new look' toggle.

Expense ID ↑	Created On
EXPENSE-100002	12/27/2023 11:24 AM

Clicking on + New Expenses, a new expense will open with the Contact field already completed.
